

VitaStim MD Pellets

A potent blend of micronutrients for lake and pond treatment

VitaStim MD Pellets are designed to slow release and sink down into the muck to deliver essential bio-stimulants, activated barley and bacteria. It penetrates and degrades your pond muck and sludge by stimulating existing bacteria and by adding sludge-eating cultures.

It is easy to apply. You can treat the entire pond or only in the areas that muck tends to accumulate. Works well in lined ponds also. Users report 9"-12" rings eaten away down to the liner where every pellet landed!

Benefits:

- Specially formulated for advanced performance in muck removal
- Clarifies the water
- Degrades organic matter that builds up on the bottom of ponds and lakes.
- Converts that muck around the pond edge to sand by eating away the organic content out of it.

Custom formulations to meet the needs of your lake or pond.

Packaging:

VitaStim MD Pellets come in 30 lb. buckets of pelletized material

Application:

It is always best to have aeration in the pond, especially if fish are present. These bacteria will consume oxygen as they eat away the muck on the bottom.

Before starting, be sure the water temperature is 60°F or higher. Initially, add about 3 lb. per 1000 ft² or 125 lbs/acre. After 2 to 4 weeks, add about 1 lb/1000 ft² or about 40 lbs/acre for maintenance. Depending on the amount of material you have to digest (low-medium-high) repeat the maintenance dosages about 2-6 times per season.
